```
This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile hydratases, ethylene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the Rhodococcus ANI2 derived plasmid pANI2 DNA described in the disclosure of the invention
                               68-71; 96pp; English.

                                                                                                                                                                                                                                                                                                                                                                                   80
 acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile hydratases, ethylene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the Plasmid pRHBRI71 DNA described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ThrHisGlyLysAsnGlyTrpHisValHisValHisAlaLeuLeuMetPheSerGlyAsp

The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosyuthesis enzymes, nitrile hydratases, ethylene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the Plasmid pRHBRIT DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          forming enzyme;

The invention relates to production of aryl carotenoid compounds. The method involves transforming a host cell comprising a cyclic carotenoid having at least one beta-ionone ring with a gene encoding a carotene desaturase (CrtU) followed by growing the transformed host cell. Also provided is a method for regulating aryl carotenoid biosynthesis in a host cell. The method is useful in the production of aryl carotenoids such as isorenieratene and chlorobactene, which are useful in pharmaceuticals, food supplements, animal feed additives, food colorants and cosmetics. The present sequence represents a B. coli-Rhodococcus shuttle plasmid pRHBR17 nucleotide sequence
                                                                                                                                                                                                                                                                                                                                Aryl carotenoid; beta-ionone; carotene desaturase; CrtU; isorenieratene; chlorobactene; pharmaceutical; food supplement; animal feed additive; food colourant; cosmetic; crtO; ds.
                                                                                                                                                                          Production of aryl carotenoids useful in e.g. pharmaceuticals and food colorants involves bioconversion of cyclic carotenoids comprising beta-ionone ring in the presence of carotene desaturase.

The vector is a shuttle vector for a Bifidobacterium, and contains: (a) a replicated essential region originated from a plasmid pNBbl of Bifidobacterium breve ATCC 15698; (b) a replicated essential region originated from a plasmid of E. coli; and col an antibiotic-resistant gene originated from a plasmid of E. coli and an antibiotic-resistant gene originated by a Bifidobacterium. The shuttle vector can be used to transform various Bifidobacteria species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       contains specific elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |||:::|||||||

Plasmid V1V2-hCH2strept was transformed into S. lividans strain 1326 and transformatts selected. V1V2-hCH2-KA was expressed at 14mg/l. The plasmid construct contains a C42 chimera (V1V2) in which the carboxy terminal portion of the encoded protein consists of a murine immunoglobulin light chain constant region. This sequence is operably linked to the coding sequence of the signal peptide of Streptomyces LTI, modified at its 5' end by the addition of bases encoding lys-Arg. Also included in the expression vector is the sequence encoding an IgGl constant region comprising the hinge and CH2 motifs. Human IgGl is the most effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid sequences for production of CD4 chimeric protein - used to transfect streptomyces, contg. LTI signal sequence linked to pro-peptide sequence facilitating peptide cleavage.

immunoglobulin subclass at mediating cell killing by both complement and ADCC. The vectors are used for the prodn. of sol. CD4 chimeric proteins in bacterial hosts, in which the HIV gp120 binding region is joined to a region of the human Ig constant region lacking the CH3 domain, which increases the stability of the CD4, thus increasing the serum half life and/or potency against HIV infection and inhibit virus-induced cell fusion, relative to soluble CD4. This sequence encodes the Brevibacterium lactofermentum p48K protein. The invention relates to a plasmid containing a temperature sensitive replication control region (TSRCR) and a marker gene (MG). The TSRCR is derived from plasmid pAM330 harboured by Brevibacterium lactofermentum (ATCC 13869) and allows the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at a low nevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. The plasmid can be used for modifying a chromosomal gene in a coryneform bacterium, which may be used for the production of useful substances, such as amino acids, by fermentation, change their genetic traits. Therefore, the plasmid can be used for

The present invention describes a method for transforming a high temperature-resistant coryneform microbe in which the high temperature-centesistant coryneform microbe in which the high temperature-centesistant coryneform microbe is traated with a chemical changing the structure of cell wall of the microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall cresistant coryneform microbe in which the cell wall cand a DNA. Also described are: (1) transforming a high temperature resistant coryneform microbe in which the cell wall and a DNA; (2) a transformant of a high temperature-resistant coryneform microbe having weakened cell wall and a DNA; (2) a transformant of a high temperature-resistant coryneform microbe in convertion microbe in convertion to the high temperature-resistant coryneform microbe and a coryneform microbe and a coryneform microbe and a coryneform coryneform microbe and a coryneform microbe and a coryneform coryneform microbe and a coryneform coryneform microbe and a coryneform microbe and a coryneform microbe carrying both a plasmid vector derived from Coryneform microbe and a coryneform microbe. The present sequence encodes a plasmid vector derived from Coryneform microbe. The present sequence encodes a set of the present invention. The present invention relates to Coryneform bacterium in which the arginine repressor does not function normally and which produces Larginine. Coryneform bacterium is used to produce L-arginine which is useful in agents for promoting liver function and namino acid infusions or in 'comprehensive' amino acid pharmaceutical. Coryneform bacterium accumulate L-arginine to higher levels than wild-type strains, e.g. 120 compared with 20, mg/dl. The present sequence is Brevibacterium lactofermentum pSFKK replication control region DNA. This DNA is used in the construction of shuttle vector for Escherichia coli and Coryneform bacteria and temperature sensitive vector. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                34 LeuGlnGlnIleThrThrSerGluThrPheAsnAlaCysGlyArgProIleSerGlyVal 53

This sequence encodes the Brevibacterium lactofermentum pSFK6 protein.
The invention relates to a plasmid containing a temperature sensitive
The invention relates to a plasmid containing a temperature sensitive
Carciasely and allows the plasmid to replicate autonomously at a low
temperature but does not allow the plasmid to replicate autonomously at a low
can elevated temperature in coryneform bacteria within a temperature range
in which the bacteria can grow. The plasmid can be used for medifying a
production of useful substances, such as amino acids, by fermentation, to
breeding microorganisms for the production of amino acids by
consideration. The plasmid comprises a TSRCR that allows the plasmid to
replicate autonomously at an elevated temperature in coryneform bacteria
creplicate autonomously at an elevated temperature in coryneform bacteria
within a temperature range in which the bacteria can grow. (Updated on 15
SEP-2003 to standardise OS field)

The present invention describes a method for transforming a high temperature-resistant coryneform microbe in which the high temperature-temperature-resistant coryneform microbe in traated with a chemical changing the correction of the containing the microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall of the microbe in which the cell wall of a high temperature corresistant coryneform microbe is weakened and electric pulse is applied to a solution containing the microbe having weakened cell wall and a DNA; to a solution containing the microbe having weakened cell wall and a DNA; correspond to the microbe having weakened cell wall and a DNA; correspond to the high temperature-resistant coryneform microbe in the high temperature-resistent coryneform microbe and a coryneform microbe and a coryneform microbe and a coryneform microbe and a laceformentum. The method is used for transforming a high temperature-coryneform microbe. The present sequence encodes a laceformentum pass protein sequence, which is used in an example from the present invention. The present invention relates to Coryneform bacterium in which the arginine repressor does not function normally and which produces L-arginine. Coryneform bacterium is used to produce L-arginine which is useful in agents for promoting liver function and in amino acid infusions or in 'comprehensive' amino acid pharmaceutical. Coryneform bacterium compared with 20, mg/dl. The present sequence is Brevibacterium Lactofermentum p48K replication control region DNA. This DNA is used in the construction of shuttle vector for Escherichia coli and Coryneform bacteria and temperature sensitive vector. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for producing L-arginine in a microorganism (e.g. coryneform bacteria) that has L-arginine producing ability and has been modified for enhanced expression of the lysE gene. The microorganism is also modified so that an arginine repressor (argR) does not function normally. The method of the invention is useful for the enhanced production of L-arginine which is useful in liver function promoting agents, amino acid infusion and comprehensive amino acid pharmaceuticals. The present sequence represents Brevibacterium

The present invention describes a method for producing ethanol using a coryneform bacterium which is transformed by DNA expressing a pyruvate decarboxylase activity and if required a gene expressing alcohol decarboxylase activity under a regulatory sequence to allow expression under ethanol production conditions. The bacterium does not proliferate under tenanol production conditions. The bacterium does not proliferate transforming the coryneform bacterium which is integrated with a gene expressing a pyruvate decarboxylase activity and if required a gene expressing alcohol dehydrogenase activity under a regulatory sequence coryneform bacterium transformed with the vector of (1). The method is used for producting ethanol. The recombinant bacterium can produce ethanol efficiently with high productivity. The present sequence represents an E. coli/coryneform bacteria shuttle vector having a PDC gene linking with a tac promoter and an ADH gene linking with a tac promoter which is used in
 Im carrying genes expressing pyruvate decarboxylase and optionally
dehydrogenase activity without substantial proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6940

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 155, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION:
TITLE OF INVENTION: ABENGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 155
FEWARD: 1606
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rgjyAspValSerGluAsnIleLeuGluSerPheSerAspAlaMetPheAspArgTrpTh 198

Patent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-02-18
PRIOR PILING DATE: 1998-02-18
PRIOR PILING DATE: 1998-02-18
PRIOR PILING DATE: 1998-02-18
